

# IT TAKES **TWO** TESTS TO DIAGNOSE HEPATITIS C!

## ANTIBODY TEST

This test looks for antibodies, which are made by the immune system.

**A POSITIVE ANTIBODY TEST MEANS THAT SOMEONE HAS BEEN EXPOSED TO HCV.**

## RNA TEST

This test looks for hepatitis C virus in the blood.

**A POSITIVE RNA TEST MEANS THAT SOMEONE CURRENTLY HAS HCV INFECTION.**

An antibody test alone can't tell us if someone has HCV!

**The good news is that HCV  
can be cured - but only if you  
know your status.**

**Talk with your medical  
provider to learn more!**
