

IT TAKES **TWO** TESTS TO DIAGNOSE HEPATITIS C!

ANTIBODY TEST

This test looks for antibodies, which are made by the immune system.

A POSITIVE ANTIBODY TEST MEANS THAT SOMEONE HAS BEEN EXPOSED TO HCV.

An antibody test alone can't tell us if someone has HCV!

RNA TEST

This test looks for hepatitis C virus in the blood.

A POSITIVE RNA TEST MEANS THAT SOMEONE CURRENTLY HAS HCV INFECTION.

The good news is that HCV can be cured - but only if you know your status!
